  Portal and Hepatic Veins and TIPS ............................................................... 80
  Arteriovenous Fistula and Interventions ....................................................... 85
  Venous Sampling ........................................................................................... 93

Chapter 4: Vascular Interventions ..................................................................... 95
  Percutaneous Embolization—Other than Cerebral, Head and Neck .............. 95
  Transcatheter Thrombolysis Other Than Intracranial .................................. 99
  Percutaneous Thrombectomy ........................................................................ 102
  Percutaneous Vascular Filter Placement, Repositioning, and Removal ............. 105
  Percutaneous Transcatheter Retrieval of Foreign Body .................................. 110
  Intravascular Ultrasound, Non-coronary .................................................... 113
  Transcatheter Biopsy .................................................................................... 115
  Transcatheter Endovascular Revascularization—Overview ......................... 117
  Transcatheter Endovascular Revascularization—Iliac Vascular Territory ........ 119
  Transcatheter Endovascular Revascularization—Femoral/Popliteal Vascular Territory ................................................................. 123
  Transcatheter Endovascular Revascularization—Tibial/Peroneal Vascular Territory ......................................................................................... 126
  Endovascular Transluminal Angioplasty—Visceral and Brachiocephalic Arteries, Aorta, and the Venous System ................................................................. 129
  Transluminal Atherectomy for Suprainguinal Arteries ................................ 136
  Transcatheter Stent Placement—Visceral and Brachiocephalic Arteries; Venous System ................................................................. 140

Chapter 5: Neurovascular Interventions ......................................................... 147
  Cerebral Endovascular Therapeutic Interventions ........................................ 147
  Percutaneous Embolization—Cerebral (Extracranial and Intracranial) ............ 150
  Temporary Balloon Occlusion ...................................................................... 155
  Percutaneous Intracranial Angioplasty ........................................................ 157
  Transcatheter Vascular Stent Placement—Cervical Carotid ............................ 161
  Transcatheter Vascular Stent Placement—Intracranial .................................. 166
  Transcatheter Vascular Stent Placement—Extracranial Vertebral or Intrathoracic Carotid Artery ................................................................. 170

Chapter 6: Vascular Access Device Placement and Therapy .......................... 173
  Non-Tunneled Vascular Access Device Placement ....................................... 174
  Tunneled Vascular Access Device Placement ............................................ 177
  Repair/Replacement/Removal of Vascular Access Device ......................... 181
  Maintenance of Vascular Access Device .................................................... 187

Chapter 7: Minor Interventional Procedures .................................................. 191
  Arthrography ................................................................................................ 191
  Image-Guided Interventional Procedures—Breast, Other than Biopsy ............. 194
  Other Biopsy Procedures .............................................................................. 202
  Aspiration Procedures .................................................................................. 207
  Image Guided Drainage Procedures ............................................................. 210
  Sclerotherapy of a Fluid Collection ................................................................ 215
  Endovenous Ablation Therapy ..................................................................... 218
  Stab Phlebectomy ......................................................................................... 221
  Venous Sclerotherapy ................................................................................... 224
  Sacroplasty .................................................................................................... 226
  Vertebroplasty ............................................................................................... 228
  Kyphoplasty .................................................................................................. 231
  Myelography ................................................................................................ 234

Chapter 8: Gastrointestinal Tract Interventions ............................................. 237
  Percutaneous Cholecystostomy ..................................................................... 237
  Percutaneous Cholangiography .................................................................... 240
  Biliary/Drainage Catheter Placement ............................................................ 243

  Biliary Stent Placement/Drainage .................................................................. 251
  Other Biliary Procedures .............................................................................. 255
  Esophageal Dilation ..................................................................................... 259
Percutaneous Vascular Filter Placement, Repositioning, and Removal

Vascular filters are placed in the inferior vena cava (IVC) in patients at risk of pulmonary embolism from known deep vein thrombosis. In the interventional radiology area, these filters are placed via percutaneous transcatheter approach. Special catheters containing a pre-loaded filter are inserted into the IVC via femoral vein or internal jugular approach and the filter is deployed. The filter grips the walls of the vena cava and is designed to “catch” clots migrating from the lower extremities. Filters may be temporary or permanent.

37191 Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed.

37192 Repositioning of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed.

37193 Retrieval of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed.

A filter is placed into the inferior vena cava percutaneously, usually through the right internal jugular vein. Fluoroscopy is used to monitor and guide the process. An incision is made just above the clavicle and then another small incision is made into the vein once it is identified. A catheter loaded with the filter is inserted into the vein and threaded through until it reaches the inferior vena cava. The filter is released from the catheter and opens to fill the diameter and grip the walls of the vena cava. The filter-loaded catheter may also be advanced over a guidewire to the vena cava after needle puncture of the internal jugular vein.

Central Venous Anatomy—Femoral Approach

**Coding Tips**

1. These codes are comprehensive codes. Component coding no longer applies.
2. Catheter placement is included in codes 37191–37193 and is not separately reported.
3. Report diagnostic inferior vena cavagram with CPT code 75825 only when performed for diagnostic purposes and the results are used to make the clinical decision to proceed with filter placement. Append modifier 59 or appropriate X modifier.
4. Temporary and permanent filter placement is coded in the same manner.
5. Report the procedure to reposition a previously placed filter with CPT code 37192. This repositioning must be a separately documented procedure.
6. Report the procedure to remove a previously placed filter with CPT code 37193.
7. Report the applicable device codes (HCPCS codes) in addition to the procedure code. Refer to the HCPCS section below for possible codes.
8. Hospitals are requested to continue reporting low osmolar contrast media separately with HCPCS Level II codes Q9965-Q9967. Report contrast media by milliliter.

**Facility HCPCS Coding**

Some applicable codes may include but are not limited to:

- C1773 Retrieval device, insertable
- C1880 Vena cava filter
- Q9965 LOCM, 100-199 mg/ml iodine concentration, per ml
Endovascular Transluminal Angioplasty—Visceral and Brachiocephalic Arteries, Aorta, and the Venous System

Angioplasty is a common procedure performed to improve blood flow in arteries or veins that have become narrowed or blocked. In the interventional radiology area, these procedures are performed by percutaneous technique using specially designed balloon catheters.

**75962** Transluminal balloon angioplasty, peripheral artery other than renal, or other visceral artery, iliac, or lower extremity, radiological supervision and interpretation

**75964** Transluminal balloon angioplasty, each additional peripheral artery other than renal, or other visceral artery, iliac, or lower extremity, radiological supervision and interpretation (List separately in addition to code for primary procedure)

A narrowing or stricture of a peripheral artery is stretched to allow a normal flow of blood. A local anesthetic is applied over the access site, usually the femoral artery, and the skin is percutaneously punctured with a needle. A guidewire is inserted and fed through the blood vessel and the needle is removed. A catheter with a deflated balloon is then advanced over the guidewire to the narrowed portion of the vessel. The balloon is inflated to stretch the vessel to a larger diameter allowing a more normal flow of blood. Several inflations may be performed along the narrowed area. Transluminal angioplasty may be done through an incision in the skin overlying the artery of access. Vessel clamps are applied and then the artery is nicked to create an opening for the balloon catheter. Report 75962 for transluminal balloon angioplasty on one peripheral artery and 75964 for each additional peripheral artery treated after the first artery. These codes report the radiological supervision and interpretation only.
